

Kavach

- 🗣️ Kavach is a chatbot for a bank's support desk.
- 🔗 It **remembers** each scam victim, and it **links** their complaint to other victims' complaints to expose the gang behind them.
- 🗄️ Its memory lives in a **Neo4j graph**.

THE PROBLEM

Scam victims get failed twice

Call 1

I lost ₹40,000 to a KYC scam...

Call 2

As I told the last agent, I lost ₹40,000...

Call 3

For the third time: I lost ₹40,000...

They repeat their story

Every call starts from zero.

Complaint 1

rkfashions7096@narmadapay

Complaint 2

rkfashions7096@narmadapay

Complaint 3

rkfashions7096@narmadapay

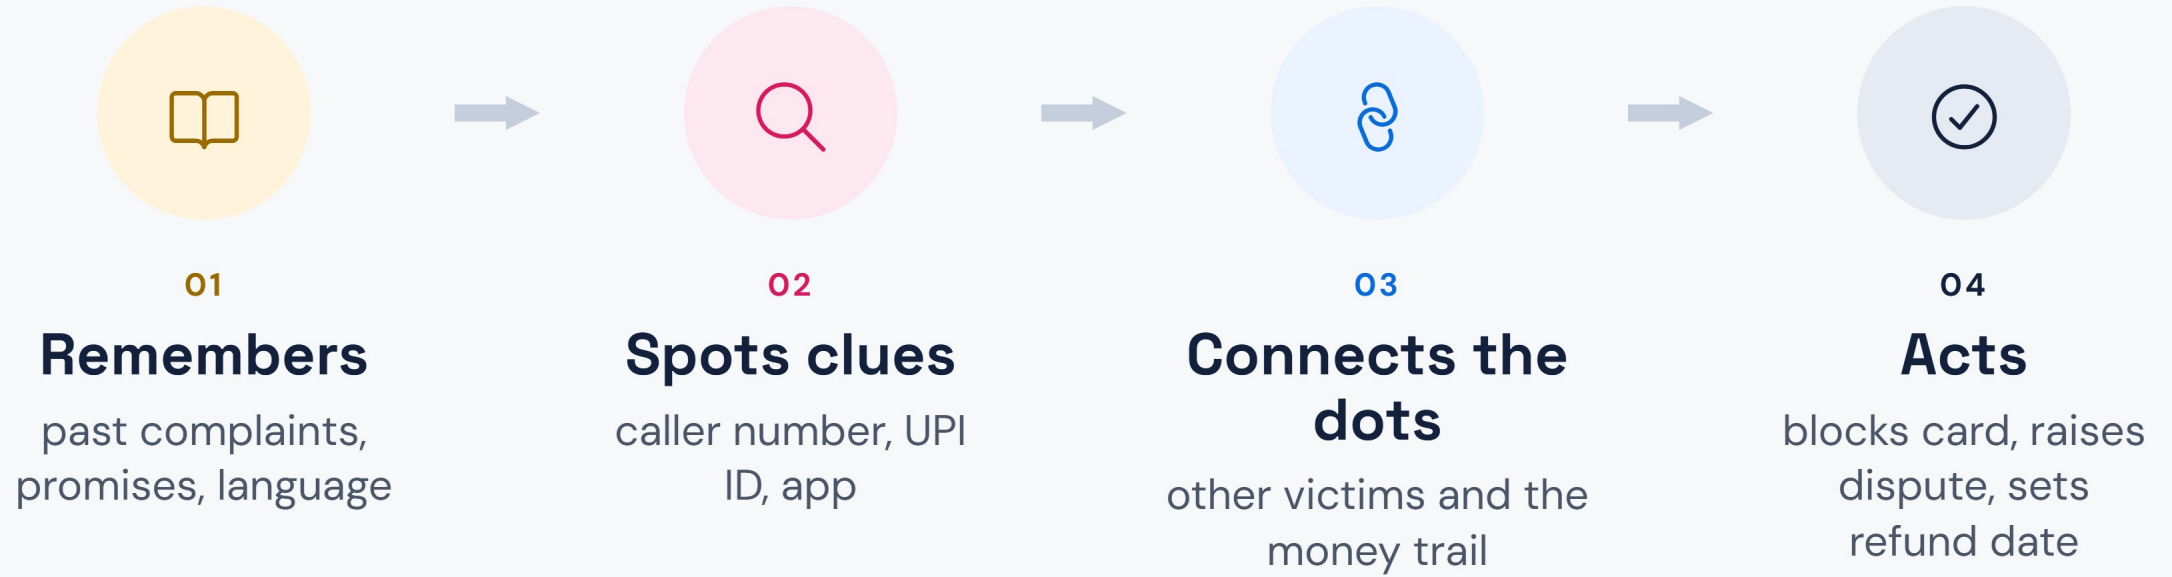

Complaint 4

rkfashions7096@narmadapay

Complaints stay separate

Same scam account, four complaints, no link.
The gang keeps working.

Four steps on every message

Everything it does is written back to Neo4j, so next time it already knows.

LIVE DEMO

Meet Anita

61 · Pune · prefers Hindi

"KYC team called, made me install AnyDesk, now ₹40,000 is gone."

She reports it once

in Hindi, no forms

The graph finds the gang

3 other victims, same UPI ID

"Koi update?"

new chat, answered
from memory

Memory OFF

same AI, knows nothing

THE GRAPH BEHIND IT

One Neo4j graph holds everything

54K

nodes

95K

relationships

Bank data

2,000 customers

2,302 accounts

36,709 transactions

544 receiving accounts

Text → graph

164 complaints

30 call transcripts

237 staff notes

15 bank docs

Kavach memory

Interactions

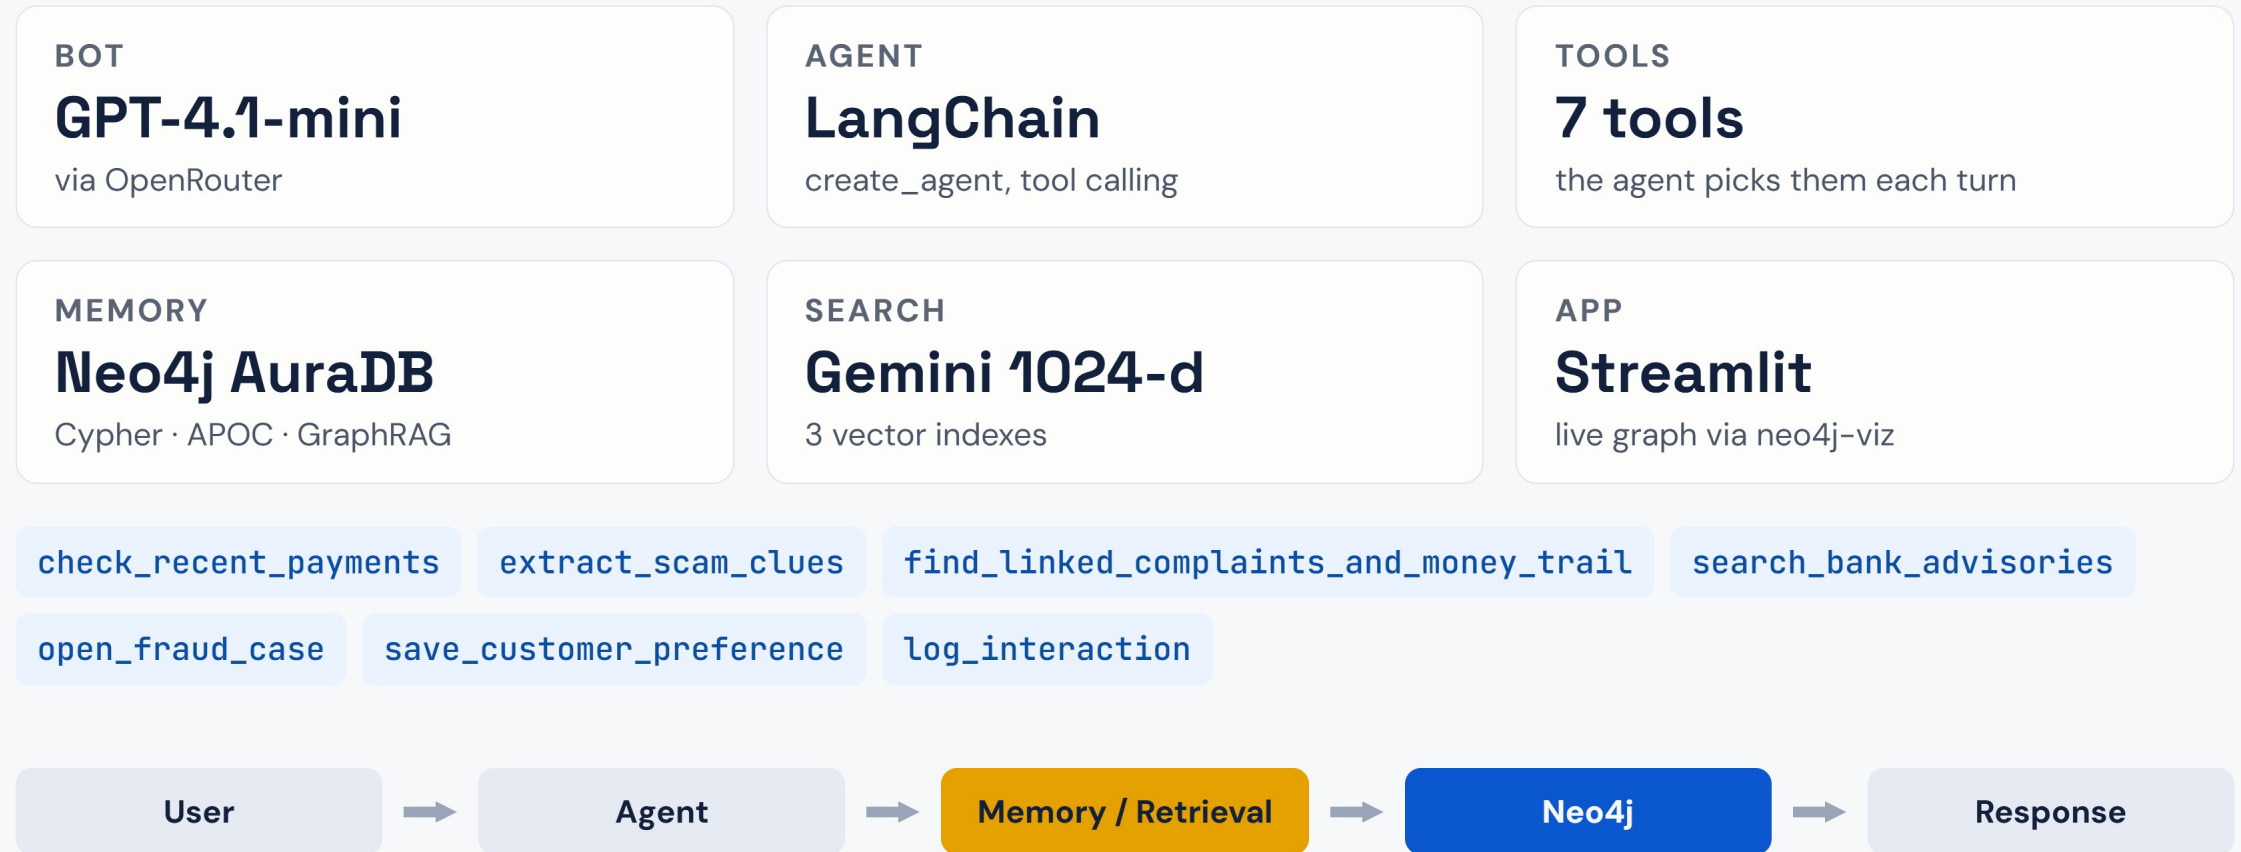

Promises

Preferences

Clue nodes (phone, UPI ID, app) tie complaints to accounts

UNDER THE HOOD

One agent, seven tools, one graph

SAFE BY DESIGN

Built for a bank

The AI never writes queries

fixed, parameterised
Cypher only

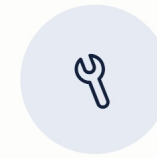

Never asks for OTP or PIN

and never blames the
customer

Every answer is traced

linked to the facts it used

Backup pipeline

if the agent fails, the same
steps still run

All data is synthetic: Sahyadri Bank does not exist.
